WIRELESS TOUR GUIDE SYSTEM

The JTS TG-10 tour guide system is a portable radio system used to transmit an audio message from a presenter to listeners. A tour guide system consists of a microphone/transmitter for the presenter and receivers with earphones for the audience.

Tour guide systems are used when normal conversation between a presenter and listeners is difficult. The TG-10 tour guide system allows the guide to be clearly heard without having to strain their voice, while reducing frustration and confusion for their clients.

The JTS tour guide system allows 4 channels (transmitters) to be used simultaneously enabling multiple tours to take place in the same venue. With a range of up to 40m outdoors and no limit to the amount of receivers used, the TG-10 tour guide system is perfect for communicating to large groups.

The transmitters and receivers can be clipped to a belt, placed in a pocket or worn on the (supplied) lanyard, allowing the system to be used hands-free. Each unit has a Lithium-ion battery which is recharged in either a dual-slot desktop charger, eighteen-slot charger case or a thirty six-slot charger case.
